

PROJECT PROPOSAL

I. Project Title

RexGrade: A GWA Calculator

RexGrade is a simple calculator that helps students calculate their GWA. The rex part is very cool

II. Problem Statement

Students need to know their GWA, but calculating it by hand can take some time. It can also be easy to make a mistake when there are many subjects with different units. This project will make the calculation easier by letting the user enter their grades and units, then calculating the GWA for them. It would help too to get an estimate even though grades aren't out yet

III. Project Objectives

1. To make a simple GWA calculator where students can enter their grades and units.
2. To calculate the GWA correctly based on the grades and units entered by the user.
3. To make the program easy to use and understand.

IV. Planned Features

- Enter the number of subjects
- Enter the subject name
- Enter the grade for each subject
- Enter the number of units
- Calculate the GWA
- Display the final GWA

V. Planned Inputs and Outputs

Inputs:

- Number of subjects
- Subject name
- Grade
- Number of units

Outputs:

- Weighted grade
- Total units
- Final GWA

VI. Logic Plan

Pseudocode

1. Start the program
2. Ask the user how many subjects they have
3. Set the total weighted grades to 0
4. Set the total units to 0
5. Ask the user for the subject name
6. Ask for the subject grade
7. Ask for the number of units
8. Multiply the grade by the units
9. Add the answer to the total weighted grades
10. Add the units to the total units
11. Repeat Steps 5 to 10 for all subjects
12. Divide the total weighted grades by the total units
13. Display the GWA
14. End the program
